

Portfolio Brief: Sujit Ammangi

Portfolio Building (B25CS0311) | Activity 12: Portfolio Blog | B.Tech CS&IT, 3rd semester, REVA University, Bengaluru

GitHub: github.com/SujitKA | LinkedIn: linkedin.com/in/sujit-ammangi | Instagram: [@ssujit_codes](https://instagram.com/ssujit_codes)

1. Purpose and audience

This brief describes the one-page portfolio blog I want built and published on GitHub Pages. Its main readers are recruiters, interviewers and faculty who have only a few minutes to understand who I am, what I have built and what I am aiming for. The page should let them verify my work quickly by linking straight to my repositories, so every claim on it must be true and checkable.

2. About me

I am Sujit Ammangi, a 3rd-semester B.Tech student in Computer Science & IT at REVA University, Bengaluru. I like understanding how things work, from code and machines to science and the universe, and I prefer learning a concept properly over only being familiar with it. I practise problem solving in C and C++, and I keep my work organised in public GitHub repositories. I am aiming for a software engineering internship at a global company such as JP Morgan.

3. What I built in the course activities

- **Activity 1, VS Code setup:** set up VS Code as my main editor and learned a range of extensions and commands (for example Prettier for formatting).
- **Activity 2, Git and GitHub:** learned to run Git and GitHub from the terminal instead of relying on buttons. My practice repository is **hello-world-c**, a Hello World program in C used to practise the workflow (github.com/SujitKA/hello-world-c).
- **Activity 3, GitLens and Live Share:** set up GitLens and Live Share in VS Code to see commit history inside the editor and to be able to code together with another person in real time.
- **Activity 4, LeetCode repository: leetcode-solutions**, written in C and grouped by topic (arrays-strings, basic-algorithms, stacks). Each problem has its own numbered folder with the solution, a short notes file and a screenshot of the accepted result, plus README and PROGRESS files. So far I have solved 9 problems on LeetCode (8 easy, 1 medium), including Two Sum, Valid Anagram, Binary Search, Move Zeroes and Valid Parentheses (github.com/SujitKA/leetcode-solutions).

4. Beyond the course

- **HackerRank portfolio: HackerRank-3rdSem-Portfolio** holds my C++ solutions, one numbered folder and README per problem (Diagonal Difference, Dynamic Array, Time Conversion, Compare the Triplets, Sparse Arrays), with screenshots of the accepted submissions. I have also earned a Silver level Problem Solving badge on HackerRank (github.com/SujitKA/HackerRank-3rdSem-Portfolio).
- **Fake News Detection:** a team project in which we built a text classifier using TF-IDF features and Logistic Regression, with a graphical interface and a written project report.
- **Online presence:** a public LinkedIn profile with a custom URL, a bio and a skills section; a networking round with recruiters and alumni; and an Instagram account (@ssujit_codes) with a Dev Journey highlight that documents my coding progress.

5. Skills

Languages: C, C++, Python. **Tools:** Git and GitHub (terminal), VS Code, GitLens, Live Share. **Practice:** problem solving on LeetCode and HackerRank (arrays, strings, hash tables, binary search, stacks).

Learning now: data structures and algorithms in more depth, and applied machine learning through project work.

6. Goals

- **Short term (this semester):** keep the LeetCode and HackerRank repositories growing with a README for every problem, and finish the hackathon and course projects with clean public repositories.
- **Medium term:** secure a software engineering internship at a global technology or finance company, and become comfortable working in a team using Git branches and pull requests.

7. What the page should contain

A single-page site with five parts, in this order: **Header** (name and one-line tagline), **About** (short, first person), **Projects** (hello-world-c, leetcode-solutions, HackerRank-3rdSem-Portfolio and Fake News Detection, each with a one-line description and, where a repository exists, a link), **Skills** (short list) and **Contact** (GitHub, LinkedIn and Instagram links only). The Fake News Detection card has no link because it is not one of my public repositories.

8. Tone, style and limits

- **Tone:** professional but approachable, first person, plain English, no buzzwords and no exaggeration.
- **Style:** clean and minimal; dark navy header with a green accent; works in light and dark mode; readable on a phone; one file, no external libraries.
- **Must not:** invent projects, numbers or skills; show an email address or phone number; or claim experience I do not have.
- **Done when:** the site loads at my GitHub Pages address and every link opens the right page.
